

■ LOW VIBRATION AND LOW NOISE BODY

1. General

Effective application of vibration damping and noise suppressant materials reduces engine, wind and road noise.

2. Sound Absorbing and Vibration Damping Materials

- Foamed urethane sponge and foamed sealing material are applied onto the roof side rail and pillars to reduce wind and road noise.
- A large-size dash inner silencer, dash outer silencer, hood silencer, and engine under cover silencer*¹ are used to reduce engine and road noise to improve quietness inside the passenger compartment.
- A material having high sound-shielding property*² is used for the intermediate film of the laminated glass of the windshield to reduce wind noise.

*¹: Except general countries

*²: Provided as standard on VX grade models for Europe, Australia and general countries

- The asphalt sheet has been optimized entirely, in terms of material, thickness, and allocation, in order to reduce the droning sound and road noise.

View from Top Side

3. Reducing Wind Noise

- A foam material is optimally allocated inside the body side members, pillars, and front header in order to reduce the wind noise created by air turbulence (See page BO-11).
- CSE (Curved Seal Extrusion) bifacial molding is used around the windshield glass to minimize the offset between the windshield glass and the roof. This reduces air turbulence and wind noise (A-A cross section).
- The offset of the front pillars and the windshield glass has been optimized to minimize air turbulence, thereby reducing the wind noise. (B-B cross section)
- Through a modification of the cowl louver shape, the course of airflow across the hood has been directed upward, and this prevents wind from interfering with the wipers. Therefore, air turbulence has been minimized, reducing the wind noise. (C-C cross section)
