

ELECTRIC POWER CONTROL SYSTEM

DESCRIPTION

- An electric power control system, which prevents the power supply voltage from temporarily decreasing when the engine is started and provides a stable power supply, is used on 2UZ-FE engine models.
- This system uses the following 2 controls to prevent the power supply voltage from decreasing excessively: The system activation timing control adjusts the activation timing of the controlled systems, and the load control suspends the system operation.
- The ECM controls this system.
